Do I need to attack the decryption algorithm and then find out, how it decrypts the data? Or is there any tool I can use? A: There is always the best method possible, the one that cannot be guessed. So the best is to apply the plaintext to the encryption algorithm and see if you can figure out the original plaintext or not. It is possible that the original plaintext can be guessed but you have to check and see if it can be guessed. If it can be guessed then you have some part of the plaintext guessable. So basically a cipher only thing is to apply the plaintext to the encryption

---

algorithm and see if you can figure out the original plaintext or not. If you can then the encryption is not very secure and you should use something else or find a secure one. But if you can't figure out the plaintext (or very little) then it can not be guessed. There is no way to find how good the encryption is. If someone has an encrypted file they can decrypt it and if they have the method they can know how good it is. Q: Ruby gem dependancy error on production I am getting this error when trying to deploy on production after making a few changes to one of the gems: ActionView::Template::Error (can't convert nil into String): I have been googling and searching SO for a while, but I can't find a solution. Does anyone have any ideas? Thanks for the help! This worked for me if ENV['DEPLOY'].blank? require 'bundler/setup' Bundler.require(\*Bundler.default\_gem\_path) end You should be getting a message in your error log showing where the error is coming from. Check the log. A very common error is 82157476af
